

## Bamboo stakes

---

Natural and economical support for the protection sleeves, they can also serve as tutor for the young plants.

The bamboo stakes that we offer come directly from China and are of the type "**TONKIN BAMBOO**" or "**TSINGLEE CANES**", which is the quality that best suits the staking of young plantations and maintenance of the sleeves.

### Use:

- Either only bamboo stakes, to hold in place light shelters (like the shelter StopLièvre GP®). In this case, it is advisable to use two or three depending on the diameter of the shelter and the type of plant to be protected.
- Or in addition to a wooden stake to hold in place the heavier shelters (like the shelters BrocarStop® GP or BrocarStop GP+®). In this case, you should choose a large enough section for maximum support of the shelter (at least a section of 10/12 mm).

### Technical data:

- Extra hard and straight
- Cannot be easily infested by worms
- Do not grow mouldy once dry
