

Synthetic ground cover

This is a woven fabric obtained from strips of **polypropylene** which gives it a high mechanical strength.

It is a **simple and economical solution** to protect plantations **against weeds** that might slow their growth. The coverage provided by the fabric will keep adequate soil moisture.

Like any mulching, using it helps **reduce the use of herbicides**.

Different weights are available depending on the type of mechanical constraints mulching will be submitted: eg. On land with very steep slopes it is advisable to use a fabric with a weight of 130 g / m².

Technical data:

- Woven small polypropylene strips
- Little permeability to water
- Anti-UV treatment
- Recyclable

Colour	Roll dimensions in m	Surface density in g / m ²
Brown Black Green	1,05	90 100 130
	1,4	
	2,10	
	3,30	
	4,20	
	5,25	

It is recommended to install synthetic ground cover using bevelled metal staples.
